Problems

- **Slow service** is an important issue which customers face while booking any service for home.

- **Security** is a major concern when a service provider visits your home.

- **No easy way exists** to book a service provider, nearest to you online.
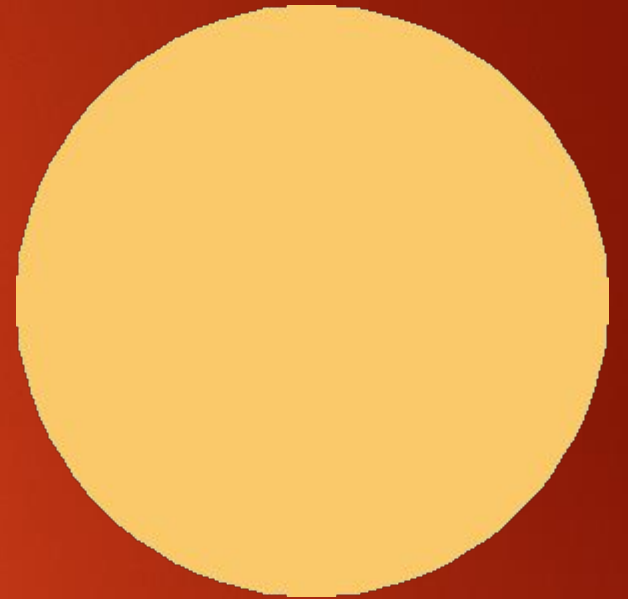

Solutions

- A web platform where users can find out the **best suitable nearest** service provider.

- The service provider will reach the destination **within an hour** of booking.

- **Check-in, Check-out** call details and **police verification** of the service provider will solve the security issues.

Future   Plan

Making a chain of other service providers like plumbers, carpenters, tutors, beauticians, etc.

Developing a System at the service providers side that automatically selects the Required Services and informs both the systems.

Problems faced in App and Website

► Lack of knowledge

► Firebase connection and Mysql in Localhost

► Java Web Hosting and tunneling(not applied), Servlets error and DAO implementation

► Final execution and complete app and website

Solutions

- ► YouTube videos for getting information and application

- ► Typical problems of SHA-1 Solved with research and work

- ► Firebase account and tutorials for connecting with firebase

- ► Google firebase for creating database

- ► Signing in encryption and authentication using google firebase

Implementation

The project works on B2B model.

Therefore, we need to have two system for both ends. Hence the Products

1) An Android App for Phone users(customers)
2) A website that works for Pc/Laptop users(customer)
3) A website that stores Potential Service providers and collects Data(Service provider)
4) A simple UI to be Given to the existing User on meetup(To be made on spot for clarification)

THANK YOU
